InSite | Environmental *Listeria* Species

InSite is a quick and easy test for the detection of *Listeria* species in food processing environments. The test contains a liquid media formulated with growth enhancers, antibiotics and chromogenic compounds specific to the growth of *Listeria* species. A color change from yellow to light brown/black is presumptive positive.

Benefits:

- Easy-to-use with no preparation steps required
- Large sponge tip maximizes sample collection for accurate results
- Eliminates costly outside lab fees for an equivalent test
- Color results are easy to interpret – brown/black indicates presence of *Listeria* species
- Positive results in as little as 24 hours
- confirmed negative results in 48 hours
- Self contained tube eliminates risk of contamination
- 12 month shelf life at refrigerated temperatures (2-8ºC)

Sensitivity:

- 1-10 CFU/mL *Listeria* spp.
- Detects heat injured *L. monocytogenes* at low levels (10-50 cfu/ml of broth), even in the presence of high numbers of competing organisms

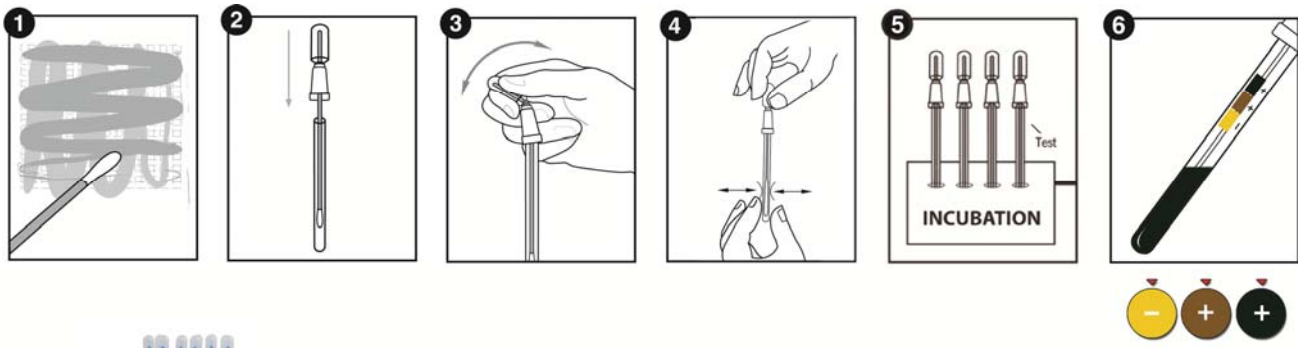
InSite Procedure:



Incubator
Easy-to-use 37°C incubator is designed to hold up to 11 Hygiena test devices.

MicroSnap Coliform
MicroSnap Coliform is a rapid test for detection and enumeration of Coliform bacteria. Results are available in 8 hours or less, depending upon required level of detection. Single figure organisms can be detected in 8 hours, enabling MicroSnap to give results in the same working day or shift. MicroSnap Coliform detects down to 1-10 CFU.

MicroSnap *E. coli*
MicroSnap *E.coli* is a rapid test for detection and enumeration of *E. coli* bacteria. Results are available in 8 hours or less, depending upon required level of detection. Microsnap *E.coli* detects down to 1-10 CFU.

MicroSnap Total
MicroSnap Total delivers total viable count (TVC) results in 7 hours, providing an advantage of knowing microbial levels in the same working day or shift. MicroSnap Total detects down to <100 CFU of Gram positive and Gram negative aerobic and facultative anaerobic bacteria.

MicroSnap Enterobacteriaceae
MicroSnap EB delivers results in 7 hours, providing an advantage of knowing microbial levels in the same working day or shift. MicroSnap EB detects down to 1-50 CFU and is an indicator for *Salmonella* spp.
